Definition. A topological space X is called a realcompact space if X is a Tychonoff space and there is no Tychonoff space X which satisfies: (RC1) there exists a homeomorphic embedding $r: X \rightarrow X$ such that $r(X) \neq \text{closure}(r(X)) = X$; (RC2) for every continuous real-valued function $f: X \rightarrow \mathbb{R}$ there exists a continuous function $f: X \rightarrow \mathbb{R}$ such that $fr = f$. 3.11.16. Theorem. For every Tychonoff space X there exists exactly one (up to a homeomorphism) realcompact space $\text{nu}X$ which satisfies: (i) there exists a homeomorphic embedding $\text{nu}: X \rightarrow \text{nu}X$ such that $\text{closure}(\text{nu}(X)) = \text{nu}X$; (ii) for every continuous real-valued function $f: X \rightarrow \mathbb{R}$ there exists a continuous function $f^*\text{nu}: \text{nu}X \rightarrow \mathbb{R}$ such that $f^*\text{nu} \circ \text{nu} = f$. The space $\text{nu}X$ also satisfies: (iii) for every continuous mapping $f: X \rightarrow Y$ of X to a realcompact space Y there exists a continuous mapping $f^*\text{nu}: \text{nu}X \rightarrow Y$ such that $f^*\text{nu} \circ \text{nu} = f$.
